

Internal Team Feedback & Peer Kudos Wall

Bonusly / Matter Alternative

Universal Security & Architecture Requirements

- **Pair Token Auth:** Short-lived JWT Access Token (15m) + Long-lived Refresh Token (7d) in `httpOnly` cookies.
- **Auth Features:** Signup with Email Verification simulation, Login with token rotation, Forgot/Reset Password.
- **UI Standard:** Build all interface components using coss.com/ui primitives.

1. Overview & Goal

Create a company recognition platform where team members receive a monthly allowance of points to celebrate peers alongside core company values, featuring a social feed and live monthly leaderboards.

2. Technical Feature Specifications

A. User Profiles & Recognition Wallets

- User Schema: `name`, `email`, `avatar`, `department`, `givingAllowance` (default: 100 pts/month), and `earnedPoints` (default: 0).
- Profile page showing individual kudos history (received vs. sent) and earned recognition badges.

B. "Give Kudos" Workflow & Point Transactions

- Modal with user autocomplete, point selector (10, 20, 50 pts), message field, and company value tag picker (`#Teamwork`, `#CustomerObsession`, `#Innovation`).
- **Transaction Safety:** Backend check ensuring sender has enough `givingAllowance`, prevention of self-gifting, and atomic point transfer.

C. Social Kudos Feed

- Company feed displaying rich cards with sender/receiver avatars, point badges, and value tags.
- Feed pagination and infinite scrolling support.
- Emoji reactions (+1, 🍌, 🔥) with optimistic UI updates.

D. Aggregated Leaderboard & Department Analytics

- MongoDB aggregation pipelines (`$group`, `$sort`, `$limit`) ranking top-recognized employees of the month.
- Filter rankings by department (`Engineering`, `Design`, `Marketing`, `Sales`).
- Monthly allowance reset logic to refresh all users' `givingAllowance` to 100 points.

3. Deliverables Checklist

Area	Deliverable Criteria
------	----------------------

Auth & Security	Pair token JWT auth, secure cookies, email verification simulation.
Logic & Safety	Atomic point transactions, anti-fraud checks (no self-tipping/negative balance).
Frontend	Coss UI components, leaderboard rankings, feed with optimistic reactions.
Repository	Seed script (<code>npm run seed</code>) with dummy users/kudos, API docs.
